INTRODUCTION:

Your physician has requested that you undergo a biliary drainage tube check and/or change to further treat the condition affecting your liver and/or bile ducts. Based on the findings of this study, additional interventions, such as a stricture dilation, stent placement, tissue sampling, or stone removal may be performed. We are asking you to read and sign this form so that we can be sure you understand the procedure and potential benefits, along with the associated potential risks, complications, alternatives, the likelihood of achieving the goals, and the recuperative process. Please ask questions about anything on this form that you do not understand.

PROCEDURE:

A biliary tube check involves injecting x-ray contrast material (x-ray dye) through the tube and taking x-ray pictures. A biliary tube change involves passing a wire through the tube in your liver, removing the tube over the wire and then replacing it with another tube. After the new tube is inserted, the wire is removed. Some numbing medicine will be injected in the skin before the wire is inserted and the tube changed. Intravenous medications may also be given to you to make you more comfortable and relaxed. This is known as moderate sedation. The procedure will be guided by an x-ray camera. The position of the tube will then be confirmed by the injection of x-ray contrast material and/or removal of fluid. X-ray pictures of your liver will then be taken. Depending on your condition, a new drainage tube may be placed, a tissue sample taken, a stone removed, or a blockage of the bile ducts opened with a balloon catheter or stent placement. If a new drainage tube is placed it will be inserted through the skin and secured in place. It may need to stay in place for a long time to allow your bile fluid to drain. Tubes in the bile system often become plugged after time, which may result in the need to replace the tube at a future date. If not replaced, a plugged tube may result in a serious infection. If an area of blockage is discovered, an attempt to open the blockage may be performed with a balloon catheter. This involves the insertion of a special tube, which has a tiny deflated balloon. The balloon is positioned at the site of the blockage and is then inflated.

Following this procedure, if there still is not enough bile flow through the area of blockage, a metal mesh tube (stent) may be placed at the site. The stent will widen the duct and improve the bile flow. If a tissue sample is to be taken or a stone removed, either of these procedures can be performed through the needle access already created in your bile system.

RISKS:

Risks associated with the procedure include, but are not limited to, pain or discomfort at the tube insertion site, bleeding at the site, internal bleeding, injury to a blood vessel, organ puncture, and infection which may result in an infection of the blood stream. Because a tube is being placed into your bile system, there is the risk of developing a bile leak that may cause peritonitis (an infection of the lining of the abdomen). There is also the risk of causing cholangitis (an infection of the bile fluid). The development of any infection, including peritonitis or cholangitis, may result in the need for intravenous antibiotics. Risks associated with the x-ray contrast material include an allergic reaction. The medications used for the moderate sedation are associated with the risks of aspiration (inhaling food or liquid into your lungs) or respiratory depression. In addition to these potential risks associated with the procedure, the x-ray contrast material, and the moderate sedation medications, there may be other unpredictable risks including death.

(ALTERNATIVES:

There may be other procedures that can be performed to further evaluate or manage your liver and/or bile duct condition. If you are unsure about having a biliary tube check/change procedure, along with a possible stricture dilation, stent placement, tissue sampling, or stone removal, please discuss these other alternatives with your physician.)

Consent for Biliary Tube Check, Change and Possible Stricture Dilation, Stent Placement, Tissue Sampling or Stone Removal

AGREEMENT:
The information on this form was explained to me by _______________________________. I understand the information and I have had the opportunity to ask any other questions I might have about the procedure, the reasons it is being performed, the associated risks, and the alternatives to the procedure. I agree to undergo the procedure to be performed by an authorized member of the Division of Vascular and Interventional Radiology and his/her associates, assistants, and appropriate hospital personnel, and accept the risks. I also agree that fellows, residents and surgical assistants may participate in significant tasks that are part of the procedure. In addition, I agree to have any other appropriate personnel present for the procedure.

I assign to the University of Pennsylvania Health System (“Health System”) all rights to any tissues, organs, cells, body parts, and/or body fluids that may be removed during this procedure and I authorize the Health System to use or dispose of such specimens according to its standard practices.

The University of Pennsylvania Health System routinely suspends all resuscitative aspects of living wills and Do Not Attempt Resuscitation orders during the pre-procedure, procedural and post-procedural period, unless you specifically tell us otherwise. This applies to all invasive and operative procedures.
